Doing Metric Conversions (more examples)

I assume you already know the following:

$$1 \text{ GHz} = 1 \times 10^9 \text{ Hz}$$

 $1 \text{ cm} = 1 \times 10^{-2} \text{ m}$

$$1 \text{ Mg} = 1 \times 10^6 \text{ g}$$

 $1 \text{ mA} = 1 \times 10^{-3} \text{ A}$

$$1 \text{ km} = 1 \times 10^3 \text{ m}$$

 $1 \mu\text{C} = 1 \times 10^{-6} \text{ C}$

$$1 \text{ nm} = 1 \times 10^{-9} \text{ m}$$

Example 1: convert 4.98×10^3 cHz to MHz

$$\frac{4.98 \times 10^{3} \times 10^{-2} \,\mathrm{Hz}}{1}$$

$$\left(\frac{4.98 \times 10^{3} \times 10^{-2} \, Hz}{1}\right) \left(\frac{1 \, MHz}{1 \, MHz}\right)$$

If this method confuses you, see below.

Change the bottom to Hz, so they cancel.

$$\left(\frac{4.98 \times 10 \text{Hz}}{1}\right) \left(\frac{1 \text{ MHz}}{1 \times 10^6 \text{Hz}}\right)$$

Exponents change signs when they move up or down in a fraction.

$$\left(\frac{4.98 \times 10^{3} \times 10^{-2} \text{Hz}}{1}\right) \left(\frac{1 \times 10^{-6} \text{ MHz}}{1}\right)$$

Add exponents.

$$4.98 \times 10^{1-6} \text{ MHz}$$

Answer.

$$4.98 \times 10^{-5} \text{ MHz}$$

The other option for the second conversion is to memorize the following:

- 1 Giga = 1×10^9 Base Units (or 1 billion)
- 1 Mega = 1×10^6 Base Units (or 1 million)
- 1 Kilo = 1×10^3 Base Units (or 1 thousand)
- 1 Base Unit = 1×10^2 Centi (or 100) 1 Base Unit = 1×10^3 Milli (or 1000)
- 1 Base Unit = 1×10^6 micro (μ) (or 1 million)
- 1 Base Unit = 1×10^9 nano (or 1 billion)

Example 2: convert 8.2×10^{-4} km to μ m

$$\frac{8.2 \times 10^{-4} \times 10^{3} \text{ m}}{1}$$

Add exponents and prepare the second conversion.

$$\left(\frac{8.2 \times 10^{-1} \text{m}}{1}\right) \left(\frac{10^6 \ \mu\text{m}}{1 \ \text{m}}\right)$$

Add exponents

$$\left(\frac{8.2 \times 10^{-1+6} \, \mu m}{1}\right)$$

Answer.

$$8.2 \times 10^5 \mu m$$

Either way is fine by me as long as you can do it. Personally, I think the second way is easier. - Murray
