

2012-13 PreAP Linear Motion 2

You will use these prefixes all year and need to gain facility with them quickly. Most formulas use base units: meter, liters, etc. The most notable exception is kilograms. Prefixes make life faster and easier. They allow experienced scientists to write formulas fast and clearly. A physicist will write 4.5 MHz on paper, but knows to put 4.5×10^6 into the calculator. 10^6 is what "Mega" stands for.

1. Let's practice converting to the base unit (use the top part of the above diagram, which you must memorize). (And asterisks mean there are answers on the back.)

- A. * 8.2 nL = _____ L B. 7.8 kHz = _____ Hz C. 3.2 μC = _____ C
 D. * 12.5 cg = _____ g E. 43 mm = _____ m F. 1.28 GW = _____ Watts

For the next step you have to know how to put large numbers into your scientific calculator. Let's talk in the calculator's language. TI uses the "EE" to mean " $\times 10$ ". So, $8EE6 = 8 \times 10^6$. Do NOT use the carat key (^). It is not the same thing and will cause you to be off by a power of ten. Only use the carat key for non-standard powers (like taking something to the 3rd power).

Q1 is step one in large metric conversions. Always start by converting back to the base unit, which can be done in one step! Then you need to set up a conversion factor to get to the next unit. This is much more accurate than moving the decimal.

2. Practicing writing metric conversion factors (bottom of above diagram).

- A. * 1 Mg = _____ g B. * _____ J = 1 kJ C. 1 nm = _____ m

Now we put these two together, as seen below. Again, please follow my procedure. Don't move the dot.

3. * Convert 75 km to mm.

- A. Step one: convert 75 km to m, using scientific notation:

 B. Step two: write the conversion factor from m to mm ($1m = \text{how many } mm?$):

 C. Step three: use the conversion factor to convert from m to mm:

4. * Now, on your own. Convert 95 μT to MT, giving your number in scientific notation.

5. Convert 2.85×10^{-5} GL to cL:

3.3 ft = 1 m	5280 ft = 1 mi
12 in = 1 ft	2.54 cm = 1 in.
I assume you know about seconds, mins, etc	

Notes for "Conversions" in the PreAP notes section.

6. A. Convert 25 cm to inches, using the following method.

B. Now convert your answer to feet.

More on back.

There are “Linear Equation” notes available online for you to follow in case you would like them! And for the REALLY lost, there are Study Helps, too.

3.3 ft = 1 m 5280 ft = 1 mi
 12 in = 1 ft 2.54 cm = 1 in.
 I assume you know about seconds, mins, etc

8. Use the graph at the left to answer the following:

- A. How many “good points” are there?
- B. ON THE GRAPH calculate the slope of the line, including units. (Study Help available)
- C. What is the y-intercept for this line, with units?
- D. Write the linear equation for this line. In $y = mx + b$, for “y” and “x” put P and t and the other quantities you found.

$$y = mx + b$$

becomes: $___ = ___ ___ + ___$

1A) $8.2 \times 10^{-9} \text{ T}$
 3A) $75 \times 10^3 \text{ m}$ 3B) $1 \text{ m} = 10^3 \text{ mm}$ 3C) see below
 1D) $12.5 \times 10^{-2} \text{ g}$ then $1.25 \times 10^1 \times 10^{-2} \text{ g} = 1.25 \times 10^{-1} \text{ g}$ 2A) $1 \text{ Mg} = 10^6 \text{ g}$ 2B) $10^3 \text{ J} = 1 \text{ kJ}$
 4) $9.5 \times 10^{-11} \text{ MT}$
 6I) not possible 6II) 301 m/s 6IV) 6049.85 m
 6III) not possible!

$\frac{7.5 \times 10^3 \text{ m}}{10^3 \text{ mm}} \left(\frac{1 \text{ m}}{10^3 \text{ mm}} \right) = \frac{1}{10^3} \times 7.5 \times 10^3 \text{ mm} = 7.5 \text{ mm}$
 or $7.5 \times 10^3 \text{ mm}$
