

2010-11 PreAP Forces 2

- Four masses are connected by ropes.
 - Since they are not on the table, which force cannot be acting on m_3 and m_4 ?
 - Below are the force diagrams for each of the mass. Label them correctly.

- Use the three diagrams at the left to answer the following.

- | | |
|---|--|
| A. ___ Which could be at rest? | G. ___ Could be changing direction. |
| B. ___ Acceleration is negative. | H. ___ Has unbalanced forces. |
| C. ___ Acceleration is positive. | I. ___ v could = 0 m/s. |
| D. ___ Has a net force of 0 N. | J. ___ Could be a constant speed. |
| E. ___ Has a net force ($F_{net} \neq 0$) | K. ___ Could be slowing down to the left. |
| F. ___ Has balanced forces. | L. ___ Could be slowing down to the right. |

- A force pushes the cart to the right. Draw where the ball ends up.

- Slim Jim pushes on a 12 kg object for 10 seconds. It moves 8 m to the right while he is pushing it.
 - * Below the picture use the kinematic equations to calculate the acceleration of the mass.
 - Now, use $F = ma$ to calculate the magnitude of Slim Jim's force.
 - If the surface is frictionless, how does v_3 compare to v_2 ?
 - If the surface has friction, how does v_3 compare to v_2 ?

There are two major categories of forces: *contact forces* (when touching occurs) and *field forces* (forces at a distance).

- Contact or Field force?

A. ___ Tension	C. ___ Can cause accelerations	E. ___ Electrostatic force
B. ___ Normal force	D. ___ Gravity	(like a balloon rubbed on hair)

Why this matters: Newton's Third Law: "For every force there is an equal and opposite force." But this opposite force must be of the same type: *contact forces oppose contact forces; field forces oppose field forces.*

- A box is sitting on a table.
 - What force opposes the normal force pushing up on the box?
 - What force opposes the force of weight pulling down on the box?

A 500 g object is attached to a spring scale by a string. The mass is given three different accelerations. Use $g = 10 \text{ m/s}^2$

Big Hint:
 $1000\text{g} = 1 \text{ kg}$
 (work in kilograms)

7. A. * Calculate the tension in the string when $a = 0 \text{ m/s}^2$.
- B. Does the scale read more, less, or the same as the weight of the object?

8. A. Calculate the tension in the string if the $a = 4 \text{ m/s}^2$.
- B. Does the scale read more, less, or the same as the weight of the object?

9. A. Calculate the tension in the string if the $a = -5 \text{ m/s}^2$.
- B. Does the scale read more, less, or the same as the weight of the object?

10. *An 8 kg object is pulled by a 10 N force while a 5 N force pushes down on it. Friction is trying to oppose the 10 N force.

- A. Calculate and label the weight and normal force. (Use $g = 10 \text{ m/s}^2$.)
- B. How much force tries to keep the object from sliding?
- C. How much force tries to stop the object from sliding (if already moving)?
- D. Is the 10 N force strong enough to move the object?
- E. How much more force is necessary for it to break free?
- F. If the object is already sliding, calculate the acceleration of the object.
- G. If $F_s = \mu_s F_N$ and $F_k = \mu_k F_N$, calculate the coefficients of friction for this surface (μ_s and μ_k).

11. Use the diagram at the left to answer the following.

- A. Calculate and label the weight and normal force. (Use $g = 10 \text{ m/s}^2$.)
- B. How much force tries to keep the object from sliding?
- C. How much force tries to stop the object from sliding (if already moving)?
- D. Is the 20 N force strong enough to move the object?
- E. If the object doesn't slide, how much more force is necessary for it to break free?
- F. If the object does slide, calculate the acceleration of the object.
- G. Calculate the coefficients of friction for this surface.

Q4A: You have v_i , t , and x , so $a = 0.16 \text{ m/s}^2$

Q7: First, convert to kilograms: $m = 0.5 \text{ kg}$

Then $F = ma$. Put in the forces, mass, and acceleration: $T - mg = ma$; $T - (0.5)10 = (0.5)0$; $T - 5 = 0$; $T = 5 \text{ N}$, which is the same as the weight because the acceleration is zero.

Q10: A. $mg = 80 \text{ N}$; $F_N = 80 + 5 = 85 \text{ N}$; Normal force is increased when an additional force pushes down.

B. 12 N (static friction tries to keep an object from sliding)

C. 3 N (kinetic friction only occurs when the object is already sliding)

D. No, $12 > 10$.

E. You can figure this out.

F. $F = ma$ and since it is sliding you have to use kinetic friction.

$$10 - 3 = 8a; \quad 7 = 8a; \quad a = 7/8 = 0.875 \text{ m/s}^2$$

G. $F_s = \mu_s F_N$ So, $\mu_s = F_s/F_N = 12\text{N}/85\text{N} = .14$ (no units, since units cancel)

$$F_k = \mu_k F_N \quad \text{So, } \mu_k = F_k/F_N = 3\text{N}/85\text{N} = .035$$
