PreAP Energy 8

- 1. A 20 kg object is moving 4 m/s to the left.
 - A. Since it is moving to the left, is v positive or negative?
 - B. * Calculate the object's kinetic energy.
- 2. A. Write the equation for power:
 - C. What is d/t?

- B. For W, substitute Fd.
- D. * Write a new equation for power:

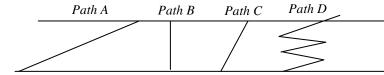

- 3. Slim Jim is pulling a mass at constant speed.
 - A. * Since the object is at constant speed, which is greater: his force or friction?
 - B. How much power is Slim Jim exerting to keep the mass at constant speed?

- 4. A. Calculate the work done on the graph for the 20 m shown.
 - B. If the force lifts a 50N object, how high was it lifted?

So, ANYTIME two quantities are multiplied in an equation (like F = ma, W = Fd, etc) on a graph you find the area.

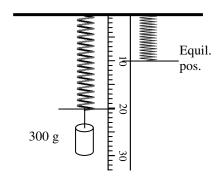

- 5. A 2 kg object is moving 2 m/s. It then accelerates to 4 m/s.
 - A. Calculate its initial kinetic energy.
 - B. Calculate its final kinetic energy.
 - C. So, by doubling its speed, its kinetic energy:

- 6. You move an object up a hill. You have four choices of paths.
 - A. If there is no friction, which path will give the most PE?
 - B. If there is friction, which path will give the most PE?
 - C. If there is friction, which will take the most work?
 - D. Which path will require the most time (assuming you walk with constant velocity)?
 - E. Which path will require the most power?

If the object is then released from the top.

- F. If there is no friction, from which path will an object have the most kinetic energy at the bottom?
- G. If there is friction, from which path will an object have the most kinetic energy at the bottom?

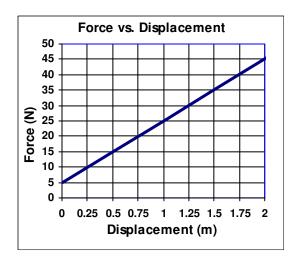

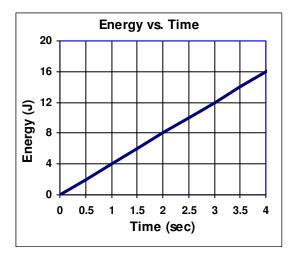

Lab questions:

- 7. A 300 g mass is placed on a spring that 10 cm long, when relaxed. The spring stretches to 20 cm.
 - A. * Calculate the force pulling on the spring.
 - B. * What is "x" in $\frac{1}{2}kx^2$?
 - C. Calculate the spring constant for this spring.

But this is not the most accurate way of finding "k" because it assumes that any mass (even a gram) will stretch the spring, which is not always true. We graphed it, instead.

PreAP Energy 8 —p2

- 8. What are the units for the spring constant?
- 9. Calculate the spring constant shown on the graph at the left.
- 10. Which axis is dependent?
- 11. Which axis is independent?
- 12. Which axis is manipulated?
- 13. Which quantity did we manipulate?
- 14. Why did we switch our graph?

Turns out that ANYTIME there is division of units you look for the slope of a graph. Examples: N/m (spring constant); m = F/a; v = D/T; $a = \Delta V/t$.

15. Given the units on the graph at the left, find the slope of the graph and figure out what it means (*units will help*).

3A) since
$$\Sigma F = \text{ma}$$
 and $F_{\text{Jim}} - F_{\text{friction}} = \text{m}(0)$, then $F_{\text{Jim}} = F_{\text{friction}} = 18 \text{ N}$
