

Projectile Motion Concepts with Diagrams

1. An object is thrown into the air going 80 m/s at an angle of 60°. How high does it go?

A. Realizing that in the y-direction projectiles are just freefall, fill in the y-direction variables.

B. Realizing that in the x-direction, projectiles are at constant speed, fill in the x-direction variables.

C. In the y-direction, calculate how high the object goes.

$$V_f^2 = V_i^2 + (2 \Delta y)$$

$$0 = 69.3^2 + (-19.6 \Delta y)$$

$$0 = 4802 - 19.6 \Delta y$$

$$-4802 = -19.6 \Delta y$$

$$\Delta y = 245 \text{ m}$$

y-dir.

$$V_i = 0 \text{ m/s}$$

$$V_f = ?$$

$$a_y = -9.8 \text{ m/s}^2$$

$$\Delta y = -7 \text{ m}$$

$$t = ?$$

$$\Delta y = (v_i t) + \left(\frac{1}{2} a t^2\right)$$

$$-7 = \frac{1}{2} (-9.8) t^2$$

$$-14 = -9.8 t^2$$

$$t^2 = 1.43$$

$$t = 1.2 \text{ sec}$$

x-dir.

$$V_i = 8 \text{ m/s}$$

$$V_f = 8 \text{ m/s}$$

$$a_x = 0 \text{ m/s}^2$$

$$\Delta x = ?$$

$$t = 1.2 \text{ sec}$$

$$S = \frac{D}{T}$$

y-dir.

$$V_i = 69.3 \text{ m/s}$$

$$V_f = 0 \text{ m/s}$$

$$a_y = -9.8 \text{ m/s}^2$$

$$\Delta y = ?$$

$$t = \text{not used}$$

x-dir.

$$V_i = 40 \text{ m/s}$$

$$V_f = 40 \text{ m/s}$$

$$a_x = 0 \text{ m/s}^2$$

$$\Delta x = ?$$

$$t = ?$$

2. An object is launched horizontally with a speed of 8 m/s.

A. Since it is launched horizontally, what is the initial y-direction velocity?

B. What is its initial x-direction velocity?

C. Again, in the y-direction projectiles are just freefall, fill in the y-direction variables.

D. In the x-direction, projectiles are at constant speed, fill in the x-direction variables.

F. In the y-direction, calculate how much time it is in the air before it hits the ground.

G. In the x-direction (at constant speed), what equation will you use?

H. Calculate how far away it landed in the x-direction, using the time you just found.

3. An object is shot 80 m/s at an angle of 60° from the ground. How far away does it land?

A. Fill in the x and y variables for the object.

B. Calculate how long it was in the air, in the y-direction.

$$V_f = v_i + (a t)$$

$$-69.3 = 69.3 - 9.8 t$$

$$-138.6 = -9.8 t$$

$$t = 14.145 \text{ sec}$$

C. In the x-direction (at constant speed), use the time you just calculated to find how far away it landed.

$$D = 40(14.14)$$

$$= 565.6 \text{ m}$$

y-dir.

$$V_i = 69.3 \text{ m/s}$$

$$V_f = -69.3 \text{ m/s}$$

$$a_y = -9.8 \text{ m/s}^2$$

$$\Delta y = 0 \text{ m}$$

$$t = ?$$

x-dir.

$$V_i = 40 \text{ m/s}$$

$$V_f = 40 \text{ m/s}$$

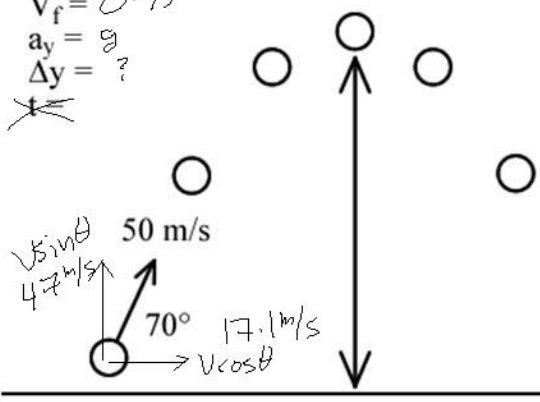

$$a_x = 0 \text{ m/s}^2$$

$$\Delta x = ?$$

$$t = ?$$

y-dir.
 $V_i = 47 \text{ m/s}$
 $V_f = 0 \text{ m/s}$
 $a_y = g$
 $\Delta y = ?$

x-dir.
 $V_i = 17.1 \text{ m/s}$
 $V_f = 17.1 \text{ m/s}$
 $a_x = 0 \text{ m/s}^2$
 $\Delta x =$
 $t =$

4. An object is shot 50 m/s at an angle of 70°. How high does it go?
 A. Use trigonometry to calculate the initial x and y velocities of the object.
 B. Fill in the x and y variables.
 C. Calculate how high the object rises.

$$V_f^2 = V_i^2 + 2a\Delta y$$

$$0 = 47^2 - 19.6\Delta y$$

$$-2209 = -19.6\Delta y$$

$$112.7 \text{ m}$$

5. An object is launched 15 m/s horizontally.
 A. Fill in the variables for the object.
 B. Solve for time in the y-direction.

y-dir.
 $V_i = 0 \text{ m/s}$
 $V_f = ?$
 $a_y = g$
 $\Delta y = -12 \text{ m}$
 $t =$

x-dir.
 $V_i = 15 \text{ m/s}$
 $V_f = 15 \text{ m/s}$
 $a_x = 0 \text{ m/s}^2$
 $\Delta x =$
 $t =$

$$\Delta y = V_i t + \frac{1}{2} a t^2$$

$$-12 = -4.9 t^2$$

$$2.448979592 = t^2$$

$$t = 1.56 \text{ sec}$$

- C. Since the x-direction is constant speed, solve for Δx .

$$S = \frac{D}{T}$$

$$D = ST$$

$$15(1.56) = 23.5 \text{ m}$$

y-dir.
 $V_i = 24.57 \text{ m/s}$
 $V_f = -24.57 \text{ m/s}$
 $a_y = g$
 $\Delta y = 0 \text{ m}$
 $t =$

x-dir.
 $V_i = 17.2$
 $V_f = 17.2$
 $a_x = 0$
 $\Delta x =$
 $t =$

6. An object is launched from the ground at a speed of 30 m/s at an angle of 55°. If it lands back on the ground, calculate how far it went horizontally.
 A. Find the initial x and y velocities from the given speed and direction.

B. Fill in the variables.
 C. Calculate time in the y-direction.

$$V_f = V_i + at$$

$$-24.57 = 24.57 - 9.8t$$

$$-49.14 = -9.8t$$

$$t = 5 \text{ sec}$$

- D. Calculate Δx .

$$S = \frac{D}{T}$$

$$D = ST$$

$$D = 5(17.2) = 86.4 \text{ m}$$
