

## PreAP Harmonic Motion 9

- 1) A **string** is 1.5 m long and produces a note that has a frequency of 150 Hz when plucked. This is  $H_1$ , the fundamental.
  - A. As a string the  $\lambda_{\text{fundamental}} = \_\_ L$ .
  - B. \* So,  $\lambda_{\text{fundamental}} =$
  - C. Calculate the speed of the wave on the string.
  - D. \* Give the first 3 possible harmonics on this string.
  - E. What part of the sound will be the same in air?
  - F. \* If the speed of sound in air is 343 m/s, what is the wavelength of the note in the air?
  
- 2) An **open pipe** 3 m long produces a 56 Hz sound as its natural frequency (fundamental).
  - A. Since it is an open pipe, the  $\lambda_{\text{fundamental}} = \_\_ L$ .
  - B. \* Calculate the wavelength of the fundamental.
  - C. In a pipe it is actually air that is vibrating, so find the speed of the wave in the pipe (*which is the speed of sound in air*).
  - D. Give the first 3 possible harmonics on this pipe.
  
- 3) An 40 cm pipe is closed at one end. When struck it naturally produces a 206 Hz sound (*its natural frequency, the fundamental*).
  - A. Since it is an closed pipe, the  $\lambda_{\text{fundamental}} = \_\_ L$ .
  - B. \* So,  $\lambda_{\text{fundamental}} =$
  - C. Calculate the speed of sound of the air in the pipe.
  - D. \* Give the first 3 possible harmonics on this pipe.

*All of the above are pretty simple if you remember that for a string or open pipe  $\lambda_{\text{fundamental}} = 2L$  and for a closed pipe  $\lambda_{\text{fundamental}} = 4L$ . And each of the three above examples work with the fundamentals only. Here's how you deal with other examples, easily.*
  
- 4) \* A **closed pipe** is 20 cm long. The third harmonic on the pipe is 1275 Hz. Calculate the velocity of air in the pipe.
  - A. You need the wavelength and frequency of one particular harmonic on the pipe. So, calculate the frequency and wavelength of the fundamental.
  - B. You can now use the wave equation to calculate the wave speed.
  
- 5) If the speed of sound in air is 336 m/s. An open pipe makes a fourth harmonic of 480 Hz. What is the length of the pipe?
  - A. Calculate the frequency of the fundamental.
  - B. Calculate the wavelength of the fundamental.
  - C. Knowing that  $\lambda_{\text{fundamental for an open pipe}} = \_\_ L$ , calculate the length of the pipe.

\* 1) B: 3m; D:  $f_1 = 150$  Hz;  $f_2 = 300$  Hz; etc. F: 2.9 m/s; Q2) B: 6 m; D: all harmonics possible, so just multiply  $f_1$  by 1.2, 3, Q3) B: 1.6 m; D: only odd harmonics this time (close pipe). Q4) A:  $\lambda_1 = 4(.2) = 0.8$  m;  $f_1 = 1275/3 = 425$  Hz B:  $v = 340$  m/s
