

A-Day: Due Fri., Jan 8  
 B-Day: Due Mon., Jan 11

# 2009-10 Fall Finals 1

1. In his latest botched attempt to impress Slim Kim, Slim Jim rides his skateboard off the top of a horizontal roof.
  - A. What kind or kinds of energy does he have just as he leaves the roof?
  - B. Calculate his total energy as he leaves the roof.
  - C. Since he leaves the roof horizontally, what is his initial y-velocity:  $v_{iy} =$
  - D. What is his acceleration in the x-direction:  $a_x =$
  - E. What is his acceleration in the y-direction:  $a_y =$
  - F. Does he go up 18m or down 18m?
  - G. What is his vertical displacement as he falls to the ground:  $\Delta y =$
  - H. Under the diagram, use a kinematic equation to calculate how long it takes for him to reach the ground.
  - I. Calculate how far away from the edge of the building he lands ( $\Delta x$ ).

2. Slim Jim is 95 kg in his astronaut suit. Give Slim Jim's mass and weight in all three of the following situations.

As he is training on the earth:  
 $m =$              $F_w =$

As he is fixing the "Galactic Cruiser" in space:  
 $m =$              $F_w =$

As he is working on the moon:  
 $m =$              $F_w =$

3. Calculate the acceleration of the following two objects.

4. Slim Jim pulls a 5 kg object up a ramp.
  - A. Above the diagram draw the force diagram for the object if there is friction on the ramp.
  - B. Calculate the work Jim does to move it up the ramp.

C. Calculate its final energy.

D. Calculate the efficiency of the transfer.
